## LINE-ORIENTED AUTHORIZATIONS

This section discusses the use and implementation of line-oriented authorizations in SAP. Line-oriented authorizations are used to restrict Users to modifying SoD Object and Mitigation Controls at line level.

### Use

Access to customizing tables can be controlled at the row level for display or maintenance using line-oriented authorizations. So far, this access can only be controlled at the table level i.e. a User can either have access to the entire table or not at all. Authorization object S\_TABU\_LIN is used to control access at the row level. This check is carried out in addition to authorization objects S\_TABU\_DIS and S\_TABU\_CLI. The use of line-oriented authorization is optional.

The new authorization object S\_TABU\_LIN now allows, in addition to the existing authorization concept, client-specific assignment of authorizations for business entities. Organizational criterion in a cross-client table which only allows a User to display and change table contents for one work area, i.e. a country can also be defined. The organizational criterion enables a business concept to be mapped to table key fields.

Please note these authorizations only work with customizing data display and maintenance transactions. It does not work for data browser transactions like SE16, SE17 at this point.

### Implementation

The following steps are executed to implement line-oriented authorization:

- Design Organization Criteria
- Define Organization Criteria
- Define Attributes
- Assign Attributes to Table Fields
- Include Authorizations for S\_TABU\_LIN in Roles
- Activate Organization Criteria

### Design Organization Criteria

- Analyze requirements
- Identify tables and fields to be protected
- Identify Users & Roles to be impacted
- Review design

### Define Organization Criteria
